

2016 Rabies Annual Summary
Wadsworth Center Rabies Laboratory
New York State Department of Health
April D Davis, DVM, PhD, Kim Appler, BA, Jodie Jarvis, BS, Heather Solomon,
MPH

The Rabies laboratory tested 7066 samples in 2016. Although the majority of samples were submitted from within New York state, 1065 were out of state submissions. Out of state samples were usually submitted for confirmatory testing or from a veterinary practice bordering the state of New York. The data in this report includes only New York State submissions unless otherwise indicated. Additionally, some of the numbers may not equal 100% because of variations in reporting.

Bats made up the majority of specimens tested 2729 (45%) followed by cats 1000 (17%), raccoons 784 (13%), dogs 635 (11%) skunks 219 (36%), other terrestrial wildlife 208 (3.4%) rodents and lagomorphs, 170 (3%), other domestic 87 (1.4%), and cattle 83 (1.4%).

Of the 6001 samples, 392 (6.5%) were positive for rabies. Raccoons accounted for the greatest number of rabid samples 156 (27%), followed by bats 81 (1.3%), skunks 79 (1.3%), cats 25 (0.4%), foxes 23 (0.38%), other terrestrial wildlife 9 (0.15%), rodents and lagomorphs 8 (0.13%), and cattle 6 (<0.1%). None of the dogs submitted to the rabies laboratory in 2016 were positive for rabies.

Animals included in the rodent/lagomorph group are woodchucks (88), beavers (10), muskrats (6), chipmunks (8), and rabbits (6). The other wild animal category includes fishers (18), porcupines (7), coyotes (20), bobcats (20), deer (74), bears (20), and otters (4). Animals included in the other domestic animal category are goats (32), horses (36), sheep (12), alpacas (6) pigs (5).

The overall incidence of rabies in each species was skunk (36%), fox (27%), raccoon (20%) cattle (7.2%), other domestic (7.2%), rodent/lagomorph (4.7%), other wild animals (4.3%) bat (3.0%) and cat (2.5%).

Cats continue to be the commonly submitted domestic species in New York State. Of the 1000 cats submitted for rabies testing, 457 (46%) were owned. Of the 25 cats that were positive for rabies, 6 (24%) were owned, none of which had a current rabies vaccination. The vaccination status of the 16 rabid wild cats were either unknown or unvaccinated. One history associated with a rabid wild juvenile cat indicated current rabies vaccination. It is unknown if this was a data entry mistake or an animal who received the vaccination younger than 3 months old.

Despite several low cost or free rabies vaccination clinics around New York State, the majority of cats submitted, including owned cats, were unvaccinated. Unvaccinated cats accounted for 243 cats submitted and 101 of the unvaccinated cats were owned. Indeed, only 22% of the owned cats were currently vaccinated against rabies. There were 101 vaccinated cats submitted for testing, 93 were owned and 6 were wild. Of the 162 cats with lapsed rabies vaccination, 143 were owned. The vaccination status of 438 cats were unknown, including 107 owned cats.

In 2016, 2729 bats were submitted for rabies testing and 81 (3%) were positive for rabies. As in previous years, 2581 big brown bats were submitted, making them the most commonly submitted species (95%), followed by 92 little brown bats (3%), 24 Silver haired bats (0.09%), 15 bats that were unable to

be speciated (<.1%), 10 red bats (<0.1%), 5 Hoary bats (<0.01%), and 2 Northern long eared bats (<0.01%).

There were 81 rabies positive bats including 77 big brown bats, 3 red bats, and 1 hoary bat. One hundred and forty-four bats were unsatisfactory for testing due to decomposition or inadequate amount/type of tissue.

More than half of the bats [1568 (57%)] submitted for testing had a history of human contact and 39 (2%) of those bats were positive for rabies. Seventy-one bats (2.6%) that were unsatisfactory for rabies testing had a history of human contact.

In 2016, 12 of the submitted histories reported raccoon bites to humans and all 12 (100%) were rabies positive. There were 181 reports of domestic or companion animals bitten by raccoons. In 93 (51%) of those instances, the raccoons were rabies positive. Of the 219 skunks submitted for rabies testing, 4 had bitten humans including two rabies positive skunks. Eighty-two of the skunks submitted for rabies testing indicated contact with domestic or companion animals and 47 (57%) were rabies positive. Of the 41 gray foxes submitted during 2016, 11 had a history of biting a human, all of which were rabies positive. There were 11 gray foxes that had contact with domestic or companion animals and 7 (64%) were rabies positive.

All rabies positive specimens were typed using real time RT-PCR. The majority of rabid animal were infected with a homologous rabies virus variant. With one exception, all terrestrial animals were infected with raccoon rabies. One cat was infected with the north central skunk variant. However, this animal was a rescue and was originally from an area in which this variant is present. All but two of the rabid bats were infected with a homologous rabies virus variant; one big brown bat was infected with a little brown bat variant and a second big brown bat was infected with a hoary bat variant.

2017 Rabies Annual Summary
Wadsworth Center Rabies Laboratory
New York State Department of Health
April D Davis, DVM, PhD, Kim Appler, BA, Jodie Jarvis, BS, Heather Solomon,
MPH

In 2017 the Rabies laboratory tested a total of 9172 samples, 6233 of which were submitted from around New York State, with the exception of New York City. The increased specimen load this year is due in large part to testing a neighboring state's rabies specimens starting May 1st, 2017. Additionally, samples were submitted from around the United States for confirmatory testing and/or rabies variant typing.

Of the 6233 samples submitted from within NY state, 581 (6%) were positive. Of the 2939 samples submitted from out of state 293 (10%) were positive for rabies. The data presented in this report is based on specimens received from NY state unless otherwise noted.

As in previous years, the majority of specimens submitted were bats 2911 (47%), followed by raccoons 820 (13%), cats 1009 (16%), dogs 634 (10%), other "wild" animals 248 (5%), skunks 199 (3.2%), rodents/lagomorphs 155 (2.5%), gray and red foxes 100 (1.6%), other domestic animals 86 (1.4%), and cattle 71 (1.1%).

Included in the rodent/lagomorph group are woodchucks (73), beavers (9), muskrats (5), chipmunks (7), and rabbits (5). The other wild animal category includes fishers (11), porcupines (7), coyote (12), wolf (1), bobcats (25), deer (119), bears (15), and otters (2). Other domestic include goats (37), horses (28), sheep (15), alpacas (7), pigs (5).

In New York State during 2017, rabies virus infection was present in 288 animals including 113 raccoons, 73 bats, 38 skunks, 28 cats, 23 fox, 4 rodent/lagomorph, 4 other wild animals, 1 cattle, and 1 dog.

The overall incidence of rabies was lower than in previous years; 23% of the foxes submitted to the laboratory for testing were positive followed by 14% of the raccoons, 19% of the skunks, 2.8% of the cats, 2.5% of bats, 2.5% of rodent/lagomorphs, 1.6% other wild, 1.4% cattle and 0.2% of the dogs.

Of the 1009 cats submitted for rabies testing, 462 were owned, 458 were reported as feral/wild/barn cats, the status of the remaining cats is unknown. Overall, 28% of the owned cats submitted to the rabies laboratory for testing were not current on their rabies vaccine, 22% were unvaccinated, and 20% were currently vaccinated. Twenty-eight cats submitted to the laboratory were diagnosed as rabid, 10 were owned, 15 were feral and 3 were of unknown history. From the 10 owned cats that were diagnosed with rabies in 2017, the vaccine history of 5 (50%) was unknown, 4 (40%) were unvaccinated and 1 (10%) had a lapsed vaccination. Of the 15 that were considered feral, the vaccination status for 8 (53%) was unknown, 6 (40%) were unvaccinated and 1(7%) was not current. The majority (64%) of rabid cats had a history of biting a human.

Conversely, the majority of dogs submitted for rabies testing are described as owned (93%) and vaccinated (58%). Twenty-seven percent of the owned dogs had an unknown vaccination history and 11% were not current. For the first time since 2011 a dog from New York State was positive for rabies. An investigation revealed the animal was an unvaccinated puppy that had a history of an altercation with an unidentified animal. The rabies virus variant infecting the puppy was a raccoon variant.

During 2017, 2.5% of the 2911 bats submitted to the laboratory were positive for rabies. Big brown bats were the most commonly submitted species (2707), followed by little brown bats (145), unidentified bats (22), red bats (16), silver haired bats (14), Northern Long Eared bats (5), and tricolored bats (2). There were 73 rabies positive bats: 71 big brown bats, 1 silver hared bat and 1 red bat. There were also 138 bats that were unsatisfactory for rabies testing due to tissue decomposition or inadequate amount/type of tissue.

Just over half of the 1605 bats (55%) submitted for testing had a history of human contact or potential human contact. Ninety-four (6%) of the bats with a history of human contact were either rabies positive or unsatisfactory for testing, both of which would indicate rabies prophylaxis.

There were 41 people bitten by raccoons in 2017 and in 11 (27%) of those cases, the raccoon was positive for rabies. One hundred and sixty-two domestic animals (dogs and cats) were bitten by raccoons in 2017 and 53 (33%) of those bites were from rabid raccoons.

All rabies positives specimens were variant typed during 2017. All host species were infected with their homologous rabies virus variant. With the exception of one gray fox and one red fox that were infected with a Big brown bat variant, the remaining terrestrial wild animals were infected with a raccoon variant. Similarly, all rabid domestic animals including 28 cats, 1 cow and 1 dog were infected with the racoon variant.

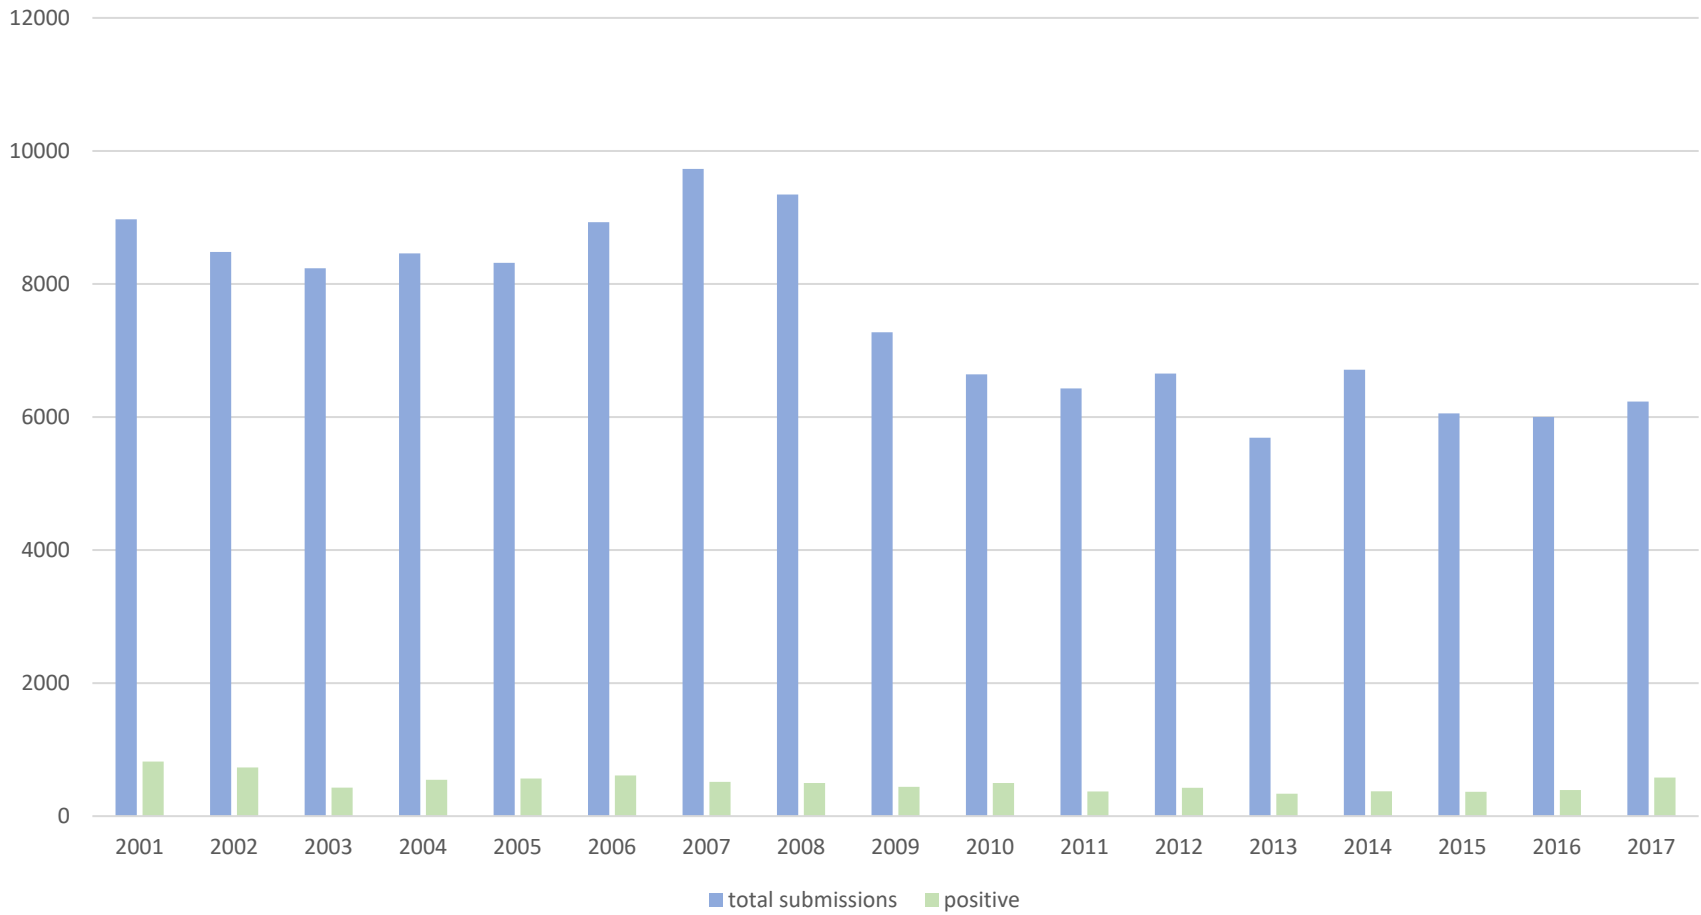

A rabid otter was found on a beach of Suffolk county. Suffolk and Nassau counties on Long island is considered mostly rabies free and the diagnosis of a rabid animal was of concern at a local, state, and national level. Conventional and whole genome sequencing was completed and results demonstrated the otter was most likely infected in a neighboring state.

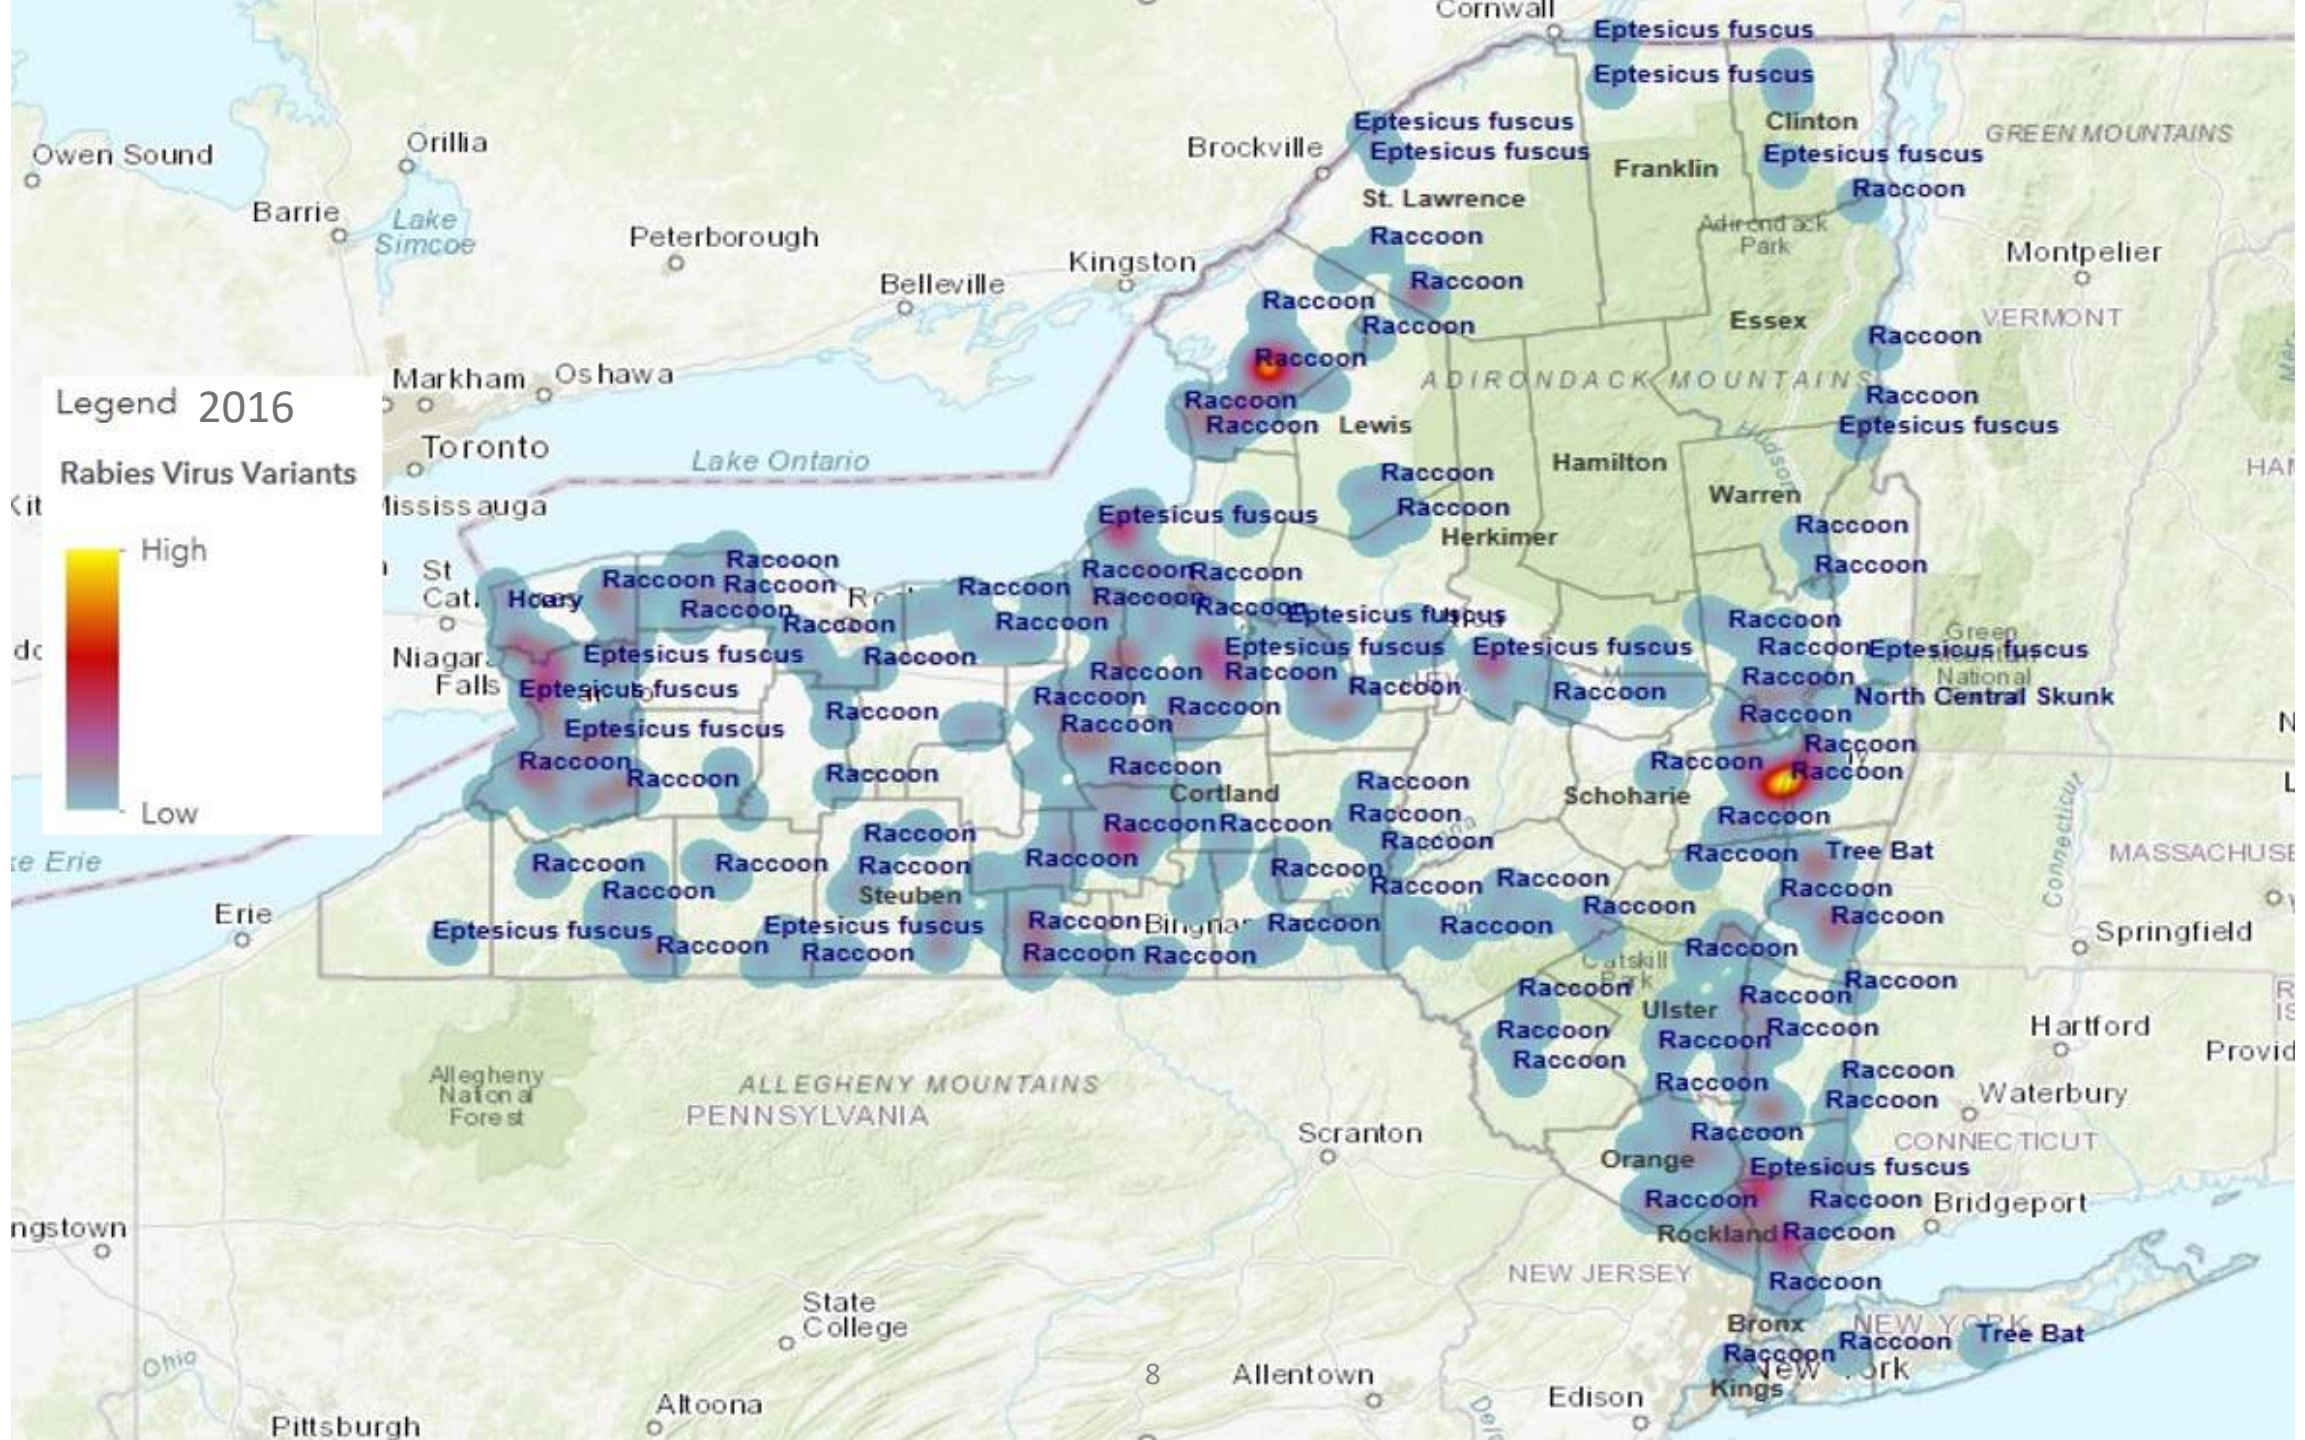

Two unusual cases occurred in 2017; in Washington county an aggressive coyote chased and viciously attacked a woman. The coyote was tested and found to be positive for rabies virus. Similarly, an aggressive white-tailed deer attacked a man in Troy, Rensselaer county. The deer later died and tested positive for rabies. Although rabies occurs occasionally in cervids in New York State, it's uncommon for them to demonstrate aggressive behavior.
