Hematology Proficiency Test Program

Statistical Summary – February 2014 (Event 14-1)

This statistical report summarizes participant data for the Hematology proficiency survey shipped 3 February 2014.

Five test samples were distributed to participants for each test category:

Routine Blood Counts (B86, B87, B88, B89, B90)

Routine Coagulation (C86, C87, C88, C89, C90)

Cell Identification (386, 387, 388, 389, 390)

Results for individual instrument and reagent systems where the number of laboratories using those systems is three or greater are provided. Mean and Standard Deviation (± 1 SD) values are calculated by a robust statistical technique that does not assume a Gaussian distribution.

Disclaimer:

Note: The use of brand and/or trade names in this report does not constitute an endorsement of the products on the part of the Wadsworth Center or the New York State Department of Health.

Should you have any questions regarding this report, please contact the Hematology Section at (518) 474-9878.

NEW YORK STATE HEMATOLOGY PROFICIENCY TESTING PROGRAM

February 3, 2014

Images on the Hematology and Clinical Chemistry web page: <http://www.wadsworth.org/chemheme/cellPT> were used to test all laboratories that perform manual white cell differentials. A summary of responses appear below, acceptable responses are shown in shaded areas.

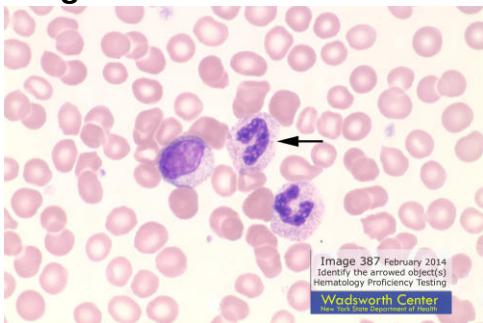

Image 386

Number of Responses	Percent of Laboratories	Cell type or finding
245	69.0%	Blast cell, not classified
65	18.3%	Myeloblast
12	3.4%	Monocyte
10	2.8%	Promyelocyte
7	2.0%	Myelocyte
6	1.7%	Reactive/Atypical lymphocyte
6	1.7%	Monoblast
2	0.6%	Normal lymphocyte
1	0.3%	Metamyelocyte
1	0.3%	Lymphoblast

The arrowed cell in Image 386 possesses a large nucleus composed of smooth chromatin and nucleoli. The nucleus to cytoplasm ratio is high and there are no visible cytoplasmic granules. The arrowed cell is best described as a blast cell. The image was obtained from the peripheral blood smear of a 64 year-old male diagnosed with acute myeloid leukemia where fifty-five percent of the cells were identified as blast cells. Given the diagnosis and the presence of an Auer rod in the blast cell beneath the arrowed cell the blast cells in this case are likely myeloblasts. Few participants classified the arrowed cell as a monoblast or lymphoblast. The characteristics of the cell, noted above, support the identification of the cell as a myeloblast. It can be difficult to classify a blast cell based solely on the peripheral blood smear, therefore, all blast types were acceptable responses.

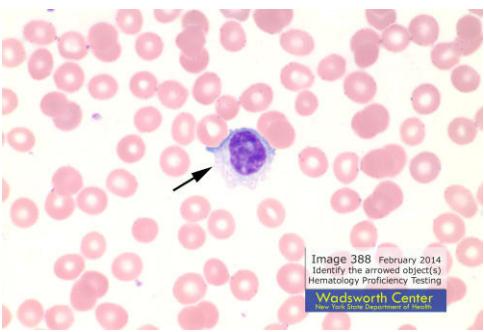

Image 387

Number of Responses	Percent of Laboratories	Cell type or finding
332	93.5%	Band neutrophil
19	5.4%	Segmented/band neutrophil with toxic granulation
4	1.1%	Segmented neutrophil

The nucleus of the arrowed cell in Image 387 is non-segmented and was correctly identified as a band neutrophil by 332 participants. The image was obtained from the peripheral blood smear of a case of chronic myeloid leukemia and, as might be expected in such a case, the cells represented the full range of the myeloid series maturation including promyelocytes, myelocytes and metamyelocytes. Approximately thirty-percent of the cells were classified as band forms.

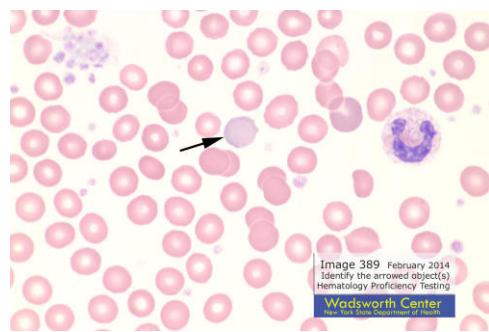

Image 388

Number of Responses	Percent of Laboratories	Cell type or finding
318	89.6%	Reactive/Atypical lymphocyte
20	5.6%	Normal lymphocyte
10	2.8%	Hairy cell
4	1.1%	Myelocytic
1	0.3%	Metamyelocyte
1	0.3%	Monocyte
1	0.3%	Lymphoma/Sézary cell

The distinctive finding of the arrowed cell in Image 388 is the reactive cytoplasm as it characteristically fringes the adjacent red blood cells. The nucleus is round and contains mature chromatin. The cell is best classified as a reactive/atypical lymphocyte as the majority of participants concur. The image was obtained from the peripheral smear of an individual with a parasitic infection where five percent of the white blood cells were classified as reactive/atypical lymphocytes.

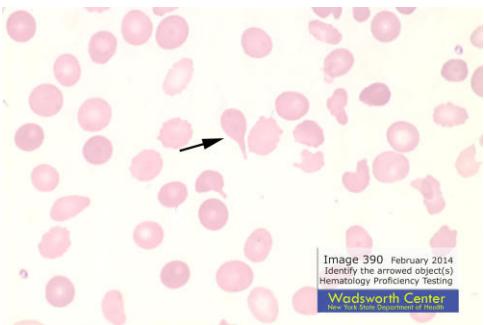

Image 389

Number of Responses	Percent of Laboratories	Cell type or finding
352	99.2%	Erythrocyte-polychromatophilic
2	0.6%	Erythrocyte-macrocytic
1	0.3%	Spherocyte

The bluish hue of the arrowed red blood cell in Image 389 was correctly distinguished by ninety-nine percent of participants as erythrocyte-polychromatophilic. Image 389 was obtained from the peripheral blood smear of a 48 year-old male diagnosed with aortic disease. At the time the specimen was collected the patient presented with a hemoglobin level of 10.0 g/dL and a hematocrit of 30.7%. Review of the peripheral blood smear revealed expected findings of such a case including polychromatophilic and hypochromic red blood cells, echinocytes, schistocytes and dacrocytes.

Image 390

Number of Responses	Percent of Laboratories	Cell type or finding
352	99.2%	Tear drop cell (dacrocyte)
3	0.8%	Target cell (codocyte)

The arrowed red blood cell in Image 390 is a tear drop cell (dacrocyte) as correctly reported by 352 participants. The image was obtained from the peripheral blood smear of a 74 year-old male who presented with a bloody stool. The laboratory data included decreased hemoglobin, hematocrit and platelet count. The red blood cell morphology showed significant poikilocytosis with schistocytes, elliptocytes, acanthocytes and tear drop cells as observed in Image 390. The marked anemia, presence of many schistocytes and the decreased platelet count indicates a miroangiopathic hemolytic anemia (MAHA). Causes of MAHA include disseminated intravascular coagulation (DIC), thrombotic thrombocytopenic purpura (TTP), severe burns, and hemolytic uremic syndrome (HUS). In this case, the anemia was caused by HUS. Most cases of HUS occur after an acute gastrointestinal illness most commonly caused by a toxin produced by *Escherichia coli*. Toxins produced by Shigella, Salmonella, Yersinia, and Campylobacter species are also known to cause HUS.
